

Inventor Who Has Developed A Device That Lets Any Car Drive 100 Miles Per Gallon Mysteriously Dies

Some people say Thomas Ogle from the United States designed a system for any car that allowed the vehicle to travel more than 100 miles per gallon without any carbon emissions back in 1977. Others say that story is nothing more than a myth. However, one thing is for sure is that Ogle passed away mysteriously just months after his work came to light.

Ogle Survived Shooting Attempt But Died Suspiciously Just Months Later

What is even more strange is the fact that Ogle was said to have survived one attempt to take his life, only to succumb it just months later under circumstances that very suspicious.

Three years before his death Ogle had spoken to a journalist, this was in 1978. He was asked, "Are you afraid of oil companies or the Arabs coming after you?" Ogle gave the reply, "No. Not anymore. I've had too much publicity. If I'd kept my invention a secret I might be worrying. But there's nothing to worry about anymore." Little did Ogle know but this wasn't true, three years later he would be dead.

Why you're going to hear about TOM OGLE

HE CLAIMS HE DRIVES IN ONE TEST WITH A FORD GALAXIE AT 50 M.P.H. AND HAS AN INVESTOR'S MILLION-DOLLAR BETTING ON HIS INVENTION.

Tom Ogle says he can drive a 1970 Ford Galaxie at 50 miles per hour for 205 miles on only two gallons of gas. He claims to have an investor's million-dollar bet on his invention.

The story began on April 30, 1977, when Ogle revealed to the world he could drive a car 205 miles on only two gallons of gas, effectively meaning he could achieve 100MPG. The test was carried out using a Ford Galaxie from 1970. Left unmodified the vehicle gave around 13 miles per gallon. Due to this, the vehicle was heavily inspected as it was thought Ogle had hidden fuel tanks inside the vehicle, but he hadn't. During the test drive, a witness sat at the side of Ogle and swore

Ogle Drove a Car 205 Miles on Two Gallons of Gas

The story began on April 30, 1977, when Ogle revealed to the [world](#) he could drive a car 205 miles on only two gallons of gas, effectively meaning he could achieve 100MPG. The test was carried out using a Ford Galaxie from 1970. Left unmodified the vehicle gave around 13 miles per gallon. Due to this, the vehicle was heavily inspected as it was thought Ogle had hidden fuel tanks inside the vehicle, but he hadn't. During the test drive, a witness sat at the side of Ogle and swore

that the vehicle did not stop to refuel in any way during the test.

The [technology](#) invented by Ogle was so marvelous it was published in the El Paso Time along with other magazines and publications. This meant the invention of Ogle received attention around the nation.

Ogle Patented His Fuel Economy System

The Vapor Fuel System was given [US Patent #4,177,779](#), said to be a “fuel economy system for an internal combustion engine that would revolutionize the auto industry.”

The fuel economy system was described to be used in an internal combustion engine to be installed in a vehicle and would do away with the need for use of a conventional carburetor, gas tank or fuel pump. It was described as working through engine vacuum drawing vapors of fuel from the vapor tank, through the vapor conduit along with the equalizer, which is located in the intake manifold inside the engine.

The tank was made from heavy-duty steel in order for it to be able to withstand the volume of pressure from the vacuum. The air inlet valve coupled up to provide control of the accelerator pedal. The vapor equalizer distributed the air and vapor mixture into the cylinders for combustion. It was said that thanks to this the vehicle had lean fuel mixtures while offering a gas mileage of more than one hundred miles per gallon.

Professor Gerald Hawkins from Texas A&M University, a mechanical engineer, was extremely interested in the invention of Ogle. He said, "This is no hoax." He went on to say, "Ogle eliminated the carburetor and achieved what the gasoline internal combustion engine was supposed to do all along – to operate off fumes."

His Invention Was Named the Oglemobile

The invention of Ogle was given the term "Oglemobile", with those in the know stating that the invention would revolutionize the automobile industry. International backers, vehicle manufacturers, along with oil companies were among those interested in Ogle along with his invention.

One financier, C.F. Ramsey, asked to purchase the patent from Ogle along with the marketing rights. Eventually, the pair came to an agreement, signing a contract allowing the inventor to continue working on the device with the backing of Ramsey, who would then take over the patent along with distribution and development rights of the Oglemobile.

Research and Funding Stopped After Ogle Opened First of His Car Centers

However, in 1978, just months after an interview with Ogle the backer sold to Advance Fuel Systems Inc. This was something that had been planned between AFS and Ramsey, but which Ogle had no idea about. Laytner, who was interviewing Ogle said:

"Tom was a bit nervous in my later phone calls, but all seemed to be well. He would continue receiving \$5,000 a month along with funds for research and development. He'd also get 6 percent royalties when the device came to market. Advance Fuel's own engineers would develop the 'Oglemobile' for marketing and in April 1979, a still very ambitious Tom Ogle opened the first of a planned 1,000 nation-wide diagnostic car centers."

The monthly checks soon stopped, not long after Ogle opened his first car center. To his dismay, Ogle was told he would not get any royalties due to the fact AFS were working on a similar device, which was nothing to do with Ogle.

Ogle Collapsed and Died on August

17, 1981

Ogle was shot on April 14, 1981, with the assailant never being apprehended. He survived the shooting, but on August 18 Ogle went to the home of a friend after he had been out drinking and collapsed. He was pronounced dead at the El Paso Eastwood Hospital. The death of Ogle was recorded as accidental/suicide with the coroner's report suggesting he had taken alcohol along with prescription pain medication.

Scientists Developed Mass Production System For Bioengineered Human Livers

Scientists have managed to successfully create a mass production platform that is biologically accurate which can overcome some of the biggest barriers for bioengineering human liver tissues that can be used for transplant into people.

The Yokohama City University in Japan and Children's Centre for Stem Cell and Organoid Medicine in Cincinnati gave a report on December 5. Takanori Takebe MD is the lead investigator of the study and an investigator and physician at both of the institutions.

Scientists Have Been Able to Bioengineer Batches of 20,000 3D Liver Micro-buds

In the past, scientists have faced challenges that have nagged them with bioengineering human organs which effective and safe for therapeutic use said Takebe. Now thanks to the new process researchers can bioengineer single batches of as many as 20,000 3D genetically matched highly functional liver micro-buds.

When these are put together, it means the batch has enough liver cells along with size to be able to be transplanted into a person who has liver failure or they can be used for drug testing. The liver tissues are generated solely from iPSCs, which are human induced pluripotent stem cells, and this means that no animal feeder by-products have to be used in the process when making the cells for research uses. Previously this had been one of the biggest barriers to scientists being able to use the cells therapeutically.

Study Will Help People with Final Stage Liver Disease In The Future

Lead investigator Takebe said that as they are able to overcome issues in the generation of 3D liver buds that are highly functional, the production process is close to complying with the standards, which are clinical grade. He went on to say that this would allow them to help people who have liver disease in the final stage. Takebe said that the goal was to be able to save children who needed to undergo a liver transplant as they would be able to overcome any shortage of donors.

The researchers did say that before any clinical trials could get underway more research is needed and the process needs refining. The estimation for this is within the next two years, five at the most. The work on the production process has been thanks to a team of international scientists, with the majority coming from Cincinnati and Japan. Studies undertaken over the past five years have made progress continually in regards to defining genetic and molecular blueprints that are precise, which are needed to copy natural human development. This is going to allow the researchers to make 3D mini-livers that are functional in the laboratory.

For Takebe and the researchers to be able to overcome the issue of animal-product feeder cells, they made use of a formula of molecular and genetic components that had been fine-tuned. They used a U-shaped bottom micro-well cell plate that had been custom designed thanks to chemistry techniques that allowed them to make a structured film that was fine in the micro-wells, that was able to nurture the liver buds as they developed.

Prior To This Scientists Had To Rely On Donors to Grow Liver Progenitor Cells

Before this, researchers had begun mass production by making use of iPSCs that came from donors to grow the three different types of liver progenitor cells that had been needed to make the healthy livers. Researchers used endothelial, hepatic endoderm and septum mesenchyme cells. The data from the study revealed that the progenitor cells were robust and highly functional and were put into the micro-wells, with the cells engaging in high levels of cross-communication on a molecular level to form into 3D liver buds that are self-organizing.

The scientists generated more than 20,000 live microspots in each of the wells, and they were capable of reaching a therapeutically viable level that was scalable. Scientists tested the 3D tissue functionality in mouse models of liver disease that was genetically programmed, and the functional organs saved the animals from liver disease.

Antarctica Secrets | ADMIRAL BYRD | Land Of Everlasting Mystery

Antarctica the white continent, and the most mysterious continent on earth. Just what exactly is this “land of everlasting mystery” as Admiral Byrd liked to call it, hiding?

Antarctica secrets includes real footage of Admiral Byrd’s South Pacific Expedition. The footage is fascinating and it reveals both the harsh conditions that exist on the continent and the impenetrable wall of ice they encountered. It also explores the more recent mysterious events that have taken place on the continent.

Admiral Byrd a seasoned Naval Officer served the U.S Navy for over twenty two years. He was also an aviator, the single greatest explorer of Antarctica and an American Hero. He won many awards and medals throughout his career ,and was a well respected international public figure. His adventures and exploration of Antarctica made him a household name and there are few who have not heard of him. Over the course of thirty years Admiral Byrd participated in five Antarctica expeditions.

He spoke of seeing vast unknown ice free lands in Antarctica and during Operation Highjump, the largest Antarctica expedition ever undertaken to this day, several oases were found, where the waters were warm and the land was capable of sustaining life. He wrote several books during his lifetime sharing some of his experiences. After his death a secret diary surfaced as well, and in that diary Admiral spoke of seeing mammoth roaming on the plains beneath him as he flew overhead in his plane, meeting with beings from a different civilization and many other astonishing things such as finding secret entrances into an inner earth.

He gave many interviews as well and was quite open at times about things the government may have preferred he not speak of. In one interview included in the video above he state that one expedition was going to Antarctica “to look for some bases”. What bases he was speaking about is unkown.

Operation Deepfreeze was the last Antarctica Expedition Admiral Byrd Took part in. That milestone expedition established permanent bases on the continent and was also the beginning of a permanent U.S presence on the continent.

So many questions need to be looked at when in comes to Antarctica. Why the need for so many permanent military bases by so many countries when military activity is forbidden on the continent due to the Antarctic Treaty. Why has most of Antarctica been closed off to the world? In a recent visit John Kerry who visited the continent signed a pact along with 24 other nations banning all private ships and citizens from travel to Antarctica’s southern coast for the next 35 years.

Buzz Aldrin visited as well and supposedly tweeted an alarming tweet along with an image of one of the recently discovered pyramids there.

Hopefully someday we will discover the secrets Antarctica hides, in the meantime we can only wonder and speculate about what's really going on there.

Archaeologists Discover Almost Perfectly Intact Biblical City Underwater

Archaeologists have been stunned by the discovery of what is said to be Corinth, the biblical city, and it is perfectly intact even though the city was wiped out 1,400 years ago when a devastating earthquake hit.

Corinth Was Rebuilt In 44 BC

The city of Corinth in Greece was rebuilt by Julius Caesar, the Roman Emperor, in 44 BC and the city has a great deal of significance for Christians. Paul, the disciple of Jesus, was said to have paid a visit and he wrote letters about the time that he spent in the city, which are in the New Testament.

Now archaeologists have found Baiae, the historic resort, which is said to be in almost perfect condition. Excavations underwater at the port of Lechaion in the harbor of Corinth have revealed the wooden foundations, and they are so well preserved that they look new.

Sediments Layers Protected the Artefacts

Other findings by archaeologists include Roman fishing lines and hooks, ceramics and wooden pulleys from Turkey and Tunisia. The experts believe that they may have uncovered an ancient lighthouse too, which has been depicted on coins that were said to have been from that era, and another monument. A

huge earthquake destroyed the region, and this saw large sediment layers cover over the artifacts, which meant that they were not destroyed by the decay, despite them being ancient.

The excavations have been made through the Lechaion Harbor Project and the director Bjorn Loven, said that for two decades he had been searching for that perfect archaeological context in which all organic material that is not found on land has been preserved. He went on to say that there is now a huge potential for finding discoveries that are more unique and it blows the mind.

Two Harbors Connected Corinth with

the City

Officials in Corinth constructed the harbor towns of Kenchreai and Lechaion so that they could take full advantage of the distance from the ocean in Greece, which was a two-mile distance. The two harbors connected the city with many trade networks in the Mediterranean along with aiding in it becoming among the wealthiest and most powerful cities in the region.

The archaeologists have also found huge blocks which weigh as much as five tons, and these were said to have been used to separate basins in the port. They are hoping to make use of research to learn how much Lechaion has changed during different time periods of history.

Body Part Trade In Detroit? Possible Human Organs Found At Wastewater Plant

It is possible that human organs may have been found at a wastewater plant in Detroit. The Medical Examiner for Wayne County said that police had found unknown tissue at the water facility. The organ found has not been identified and a spokesperson said that it might take many months before they get identification.

Object May Be A Human Kidney

The disturbing news broke when a worker came across what appears to be an organ from a human being. This is the second in as many days and it was said that it appears to be a human kidney. Police gave confirmation that they had attended the scene at 9300 W. Jefferson on Friday and they discovered what seems to be an organ from a human body.

Police said that employees had made the gruesome discovery on Friday night at Pump Station No. 1 located on the south side at No 2 Bar Rake. Evidence experts from the police were sent to the water plant and collected the suspected human organ and it was taken to the Medical Examiner's Office in Wayne County. The organ is going to be fully examined and this should determine whether or not the organ comes from a human or an animal.

The Great Lakes Water Authority is behind the maintenance of the plant and they said that an object was discovered at the plant on Friday and then another object, said to be of a nature that was similar, was located on Saturday. The police were also called to the scene upon the finding of the second object and they took it to the office of the medical examiner.

No details have been given about the second object found.

Organs Were Found In Wastewater Screening Area

The Great Lakes Water Authority did issue a statement which said that staff members had located an object in the wastewater screening area of the Water Resource Recovery Facility. This is a region at the plant that is able to filter out any debris from the water prior to it going through the treatment process. They went on to say that members of staff called the Detroit Police Department and they came and took the object. The second object was found in the same area and again the staff called the police.

It has been said that the findings do not have any effect on the water treatment process and if people have any questions about the investigation they should call the Detroit Police Department.
